

INF367A Project 2

Naphat Amundsen

May 3, 2020

Introduction

This project is about creating a bayesian recommender engine specifically for movie ratings. There are different types of recommender systems. For this project, we will focus on *collaborative filtering* where we try to predict user preferences based on preferences We are given the MovieLens 100K dataset, which essentially consists of movies, users and the users ratings for some movies.
